The present sequence representing Angiostatin protein is given in an invention providing a method for recombinant production, recovery and purification of Angiostatin protein. Purification of recombinant Angiostatin comprises applying crude fermentation broth containing the protein to an expanded bed cation exchange column, repeating the protein to an expanded bed cation exchange column, repeating the process of eluting and applying, to hydroxyapatite column, hydroxyabotic column and membrane, in order, and collecting fluid passing through the membrane. Angiostatin is useful for treating angiogenesis mediated diseases, including solid tumours, leukaemia, tumour metastases, benign tumours, rheumatoid arthritis, psoriasis, ocular angiogenic diseases, Osler-Webb syndrome, myocardial angiogenesis, plaque neovascularisation,
                                                                                                                                                                                                                                                 Purifying recombinant angiostatin, involves applying fermented containing angiostatin to expanded bed cation exchange column, exchange column, hydroxyapatite column, hydrophobic column and
                                                                                                                                                                                                           Example
                                                                                                                                                                                                                                                                                                                                                               Bermejo
                                                                                                                                                                                                                                                                                                                                                                              Madsen J,

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             telangiectasia, haemophiliac joints, angiofibroma and wound granulation. As a centrifugation technique is not employed in the process, damage to the cells with concomitant release of undesirable biological materials such as cytochromes, pigments, enzymes, chemicals and other undesirable cellular constituents and debris, is prevented. Large scale recovery and purification of proteins is greater than that obtained from prior art methods. Active Angiostatin can be stored in buffers for extended periods of time, in vials or other containers, either in solution which may be liquid or frozen, or lyophilised
                                                                                                                       (AVET

The albumin fusion proteins, compositions, vaccines and methods are useful for treating angiogenesis-dependent tumor, e.g. cancer. This sequence represents an C-terminal albumin-angiostatin fusion protein.

The albumin fusion proteins, compositions, vaccines and methods are useful for treating angiogenesi dependent tumor, e.g. cancer. This sequence represents an N-terminal angiostatin-albumin fusion protein.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  This sequence represents kringle domains 1-3 of human plasminogen. A 38 kD N-terminal fragment of plasminogen is referred to as angiostatin and inhibits neovascularisation. Angiostatin contains 4 kringle domains of the parent molecule. However, angiostatin containing all 4 kringle domains (K1-4) was found to be no more potent as an inhibitor of cell proliferation than an angiostatin only containing K1-3. Therefore, kringle 4 does not posses inhibitory activity. A fragment of the plasminogen coding sequence may be used in the recombinant viral vector of the invention for obtaining angiostatin activity. The vector comprises a promoter capable of expressing human angiostatin operably linked to a structural gene encoding one or more domains of human angiostatin. The vector, which may be a replication-defective viral vector, is useful for inhibiting angiogenesis in a mammal, especially with cancer or a tumour

The multifunctional protein may exhibit useful properties such as having similar or greater biological activity when compared to a single factor or by having improved half-life or decreased adverse side effects, or a combination of these properties. The proteins can be used for treating an angiogenic-mediated disease, e.g. cancer, diabetic retinopathy, macular degeneration, or arthritis. They can also be used for inhibiting the production of tumor cells (characteristic of lung, breast, ovarian, productien, pancreatic, gastric, colon, renal, bladder cancers; melanoma, hepatoma, sarcoma and lymphoma) in a patient and for inhibiting tumor growth. The present sequence represents a multifunctional protein of the invention
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              WPI;

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            interferon-inducible protein and platelet factor 4, and have anti-
angiogenic and/or anti-tumor activity. The multifunctional protein may
exhibit useful properties such as having similar or greater biological
activity when compared to a single factor or by having improved half-life
or decreased adverse side effects, or a combination of these properties.
The proteins can be used for treating an angiogenic-mediated disease,
e.g. cancer, diabetic retinopathy, macular degeneration, or arthritis.
They can also be used for inhibiting the production of tumor cells
(characteristic of lung, breast, ovarian, prostate, pancreatic, gastric,
colon, renal, bladder cancers, melanoma, hepatoma, sarcoma and lymphoma)
in a patient and for inhibiting tumor growth. The present sequence

                                                                                                                                                                                                                                                                                                                                                                                              The sequence represents a plasminogen fragment which is compared with the corresponding plasminogen fragments of monkey (AAR83962), pig (AAR83963) and cattle (AAR83964) origin (in Fig.2), as well as the with the first 339 amino acids of mouse angiostatin (AAR83960) (i.e. aa's 98-436 of the complete 812 as plasminogen molecule AAR83950). Human angiostatin is a plasminogen fragment starting at aa 97 or 99 of the complete plasminogen molecule. Angiostatin is an endothelial inhibitor, which reversibly angiogenesis. It is useful in the treatment of a human or animal with angiogenesis. It is useful in the treatment of a human or animal with angiogenic mediated disease e.g. arthritis, macular degeneration, diabetic retinopathy or cancer. Cells comprising angiostatin-coding sequences are useful for gene therapy of primary tumors
                                                                                                                                                                                                                                                                                                                                                                           Sequence

The fragment is preferably derived from murine, human, Rhesus, porcine or bovine plasminogen and is a briantine.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           Rhesus, porcine or bovine plasminogen and is a kringle 1, kringle 2, kringle 3, kringle 2-3, kringle 1-3, kringle 1-2, kringle 1-4 or kringle 1-4 bringle 1-5 kringle 1-7 k

of plasminogen fragments - having an amino acid sequence similar tringle 1-5 region, for inhibiting endothelial cell proliferation ç and

Example 27; Fig 2A-C; 165pp; English

of a plasminogen molecule. The plasminogen fragments can be derived from murine, human, Rhesus, porcine or bovine plasminogens. The plasminogen fragments can be used for modulating angiogenesis and treating angiogenic fragments can be used for modulating angiogenesis and treating angiogenic cenditated disease e.g. solid tumours; for treating excessive or abnormal stimulation of endothelial cells; as a birth control agent; and in the treatment of diseases that have angiogenesis as a pathological consequence (see AAW94036 for details on the various diseases the plasminogen fragments can be used to treat). The nucleotide sequences encoding the plasminogen fragments can also be used for gene therapy. The products can be used for the production of antibodies and in detection and diagnosis. Sequences AAW94037 to W4041 represent angiostatin fragments (protein derivatives of angiostatin or plasminogen, having an endothelial cell proliferation activity) of murine, human, Rhesus, can be used in the invention are indicated in the features The invention relates to inhibition of endothelial cell proliferation that comprises administering to an endothelial cell a plasminogen tragment having an amino acid sequence similar to the kringle 1-5 regions. region ed from

                                                                                                                                                                                                                                                                                The present invention relates to endothelial inhibitors called angiostatin which reversibly inhibit proliferation of endothelial cells. The invention is useful for diagnossing and treating angiogenic-mediated diseases such as cancer, arthritis, macular degeneration, diabetic retinopathy, psoriasis, scleroderma, Crohn's disease, wounds, peptic ulcer and fractures. The invention is also useful in gene therapy. The present sequence is the human angiostatin protein.
                                                                                                                                                                                                                                                                                                                                                                          Example
                                                                                                                                                                                                                                                                                                                                                                                                     Inhibiting endothelial cell proliferation, useful for treating cancer, arthritis or diabetic retinopathy, comprises administering to an endothelial cell a proliferation-inhibiting amount of an angiostatin
                                                                                                                                                                                                                                                                                                                                                                                                                                                    WPI; 2003-540796/51

The invention relates to a method of inhibiting endothelial cell corpoliferation, comprising administering to an endothelial cell a coll spale of the coll plasminogen fragment having an amino acid sequence similar to that of the coll and college in the coll plasminogen. The plasminogen fragment is derived community to the college in the following: (1) a method of treating a mammal with an angiogenic mediated disease; (2) a therapeutic composition for inhibiting conditions and college in the plasminogen fragment; and (3) a method of expressing a plasminogen college in the plasminogen fragment; and (3) a method of expressing a plasminogen college including an endothelial cell proliferation inhibiting activity. The method is useful for treating angiogenesis dependent diseases concluding cancer. Angiogenesis-mediated diseases also include rheumatoid correlation, neovescular glaucome, retrolatel fibroplassis, tubeosis, coller-Webber syndrome or myocardial angiogenesis. The present sequence corporesents human plasminogen fragment (angiostatin).
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                26-APR-1994;

a signal sequence, an immunoglobulin Fc region, and an anglogenesis inhibitor selected from angiostatin, endostatin, a plasminogen fragment having angiostatin activity, a collagen XVIII fragment having endostatin activity, or combinations of them. The fusion protein (immunofusin) is used to inhibit angiogenesis and to treat diseases or conditions mediated by angiogenesis. Conditions that may be treated include solid tumours, blood born tumours, tumour metastasis, benigh tumours including haemangiomas, accoustic neuromas, neurofibromas, trachomas and pyrogenic granulomas, rheumatoid arthritis, psoriasis, ocular angiogenic diseases e.g. diabetic retinopathy, retinopathy of prematurity, macular degeneration, corneal graft rejection, neovascular glaucoma, retrolental
                                                                                                                                                                                                                                                                Novel fusion protein of angiostatin or endostatin and an immunoglobulin FC region, useful for treating conditions mediated by angiogenesis, sucl as rheumatoid arthritis, tumors and macular degeneration.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     Human; immunoglobulin gamma Fc fragment; angiostatin; immunofusin; angiogenesis; inhibitor; cytostatic; antirheumatoid; antiarthritic; antipsoriatic; antidiabetic; ophthalmological; immunosuppressant;

The multifunctional protein may exhibit useful properties such as having similar or greater biological activity when compared to a single factor or by having improved half-life or decreased adverse side effects, or a combination of these properties. The proteins can be used for treating an angiogenic-mediated disease, e.g. cancer, diabetic retinopathy, macular degeneration, or arthritis. They can also be used for inhibiting the production of tumor cells (characteristic of lung, breast, ovarian, prostate, pancreatic, gastric, colon, renal, bladder cancers; melanoma, hapatoma, sarcoma and lymphoma) in a patient and for inhibiting tumor growth.
